PURDUE
UNIVERSITY

Profitability? What profitability?

- Grain prices half what they were during the ethanol boom not too many years ago.
- Variable input costs plus land values and cash rents followed the run-up in grain prices but remained “high” while grain prices declined.

Image source: looneytunes.wikia.com

v20151224 © Purdue University

PURDUE UNIVERSITY

So, not just about grain prices...

Yield × **Price** - **Var. Cost** = **Contrib. margin**

 What's left over to pay for fixed costs (land, machinery, labor, and family living)

Image source: www.completeaccounting.ca

v20151224 © Purdue University 3 

PURDUE UNIVERSITY

When faced with low contribution margins...

Yield × **Price** - **Var. Cost** = **Contrib. margin**

...we typically focus on reducing or eliminating variable costs, which increases contribution margins as long as yields are not reduced dramatically.

v20151224 © Purdue University 4 

PURDUE UNIVERSITY

Variable Input Costs: Typical “big ticket” items

- Fertilizer
 - Esp. N, P, K
- Seed
 - Seed cost & rate
- Pesticides
- Irrigation

Approx. 70% of total variable costs for rotation dryland corn in Indiana

v20151224 © Purdue University 5

EC872
(Revised November 2014)

CROP BUDGETS
NEBRASKA – 2015

v20151224 © Purdue University 6 

PURDUE
UNIVERSITY.

Cost-cutting options vary by...

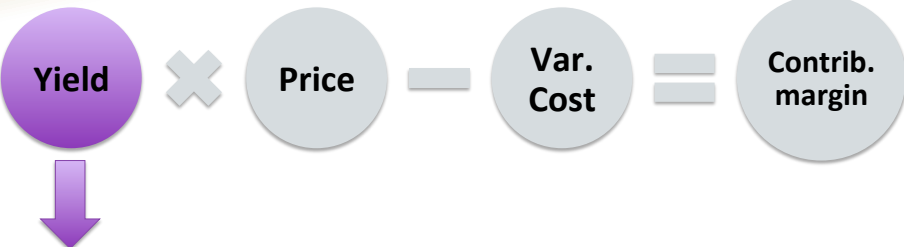

- The particulars of a farm operation's crop production inputs and...
- The cash flow situation of the farming operation.
- Know your input costs and calculate your cost per bushel.

v20151224 © Purdue University 7 

PURDUE
UNIVERSITY.

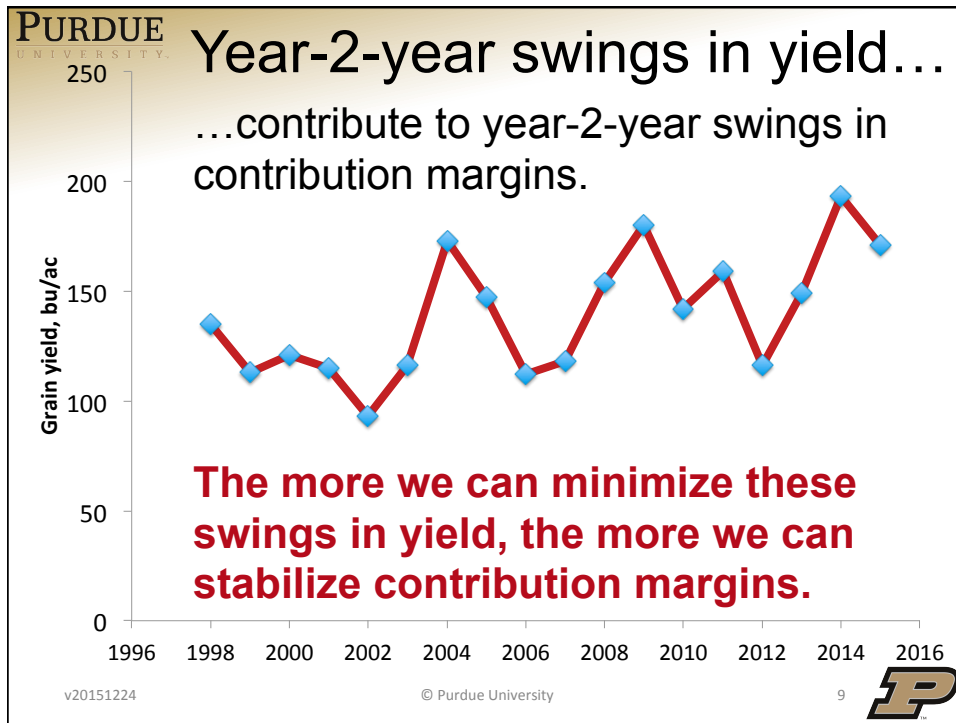

Another option is to...

Yield × Price – Var. Cost = Contrib. margin

...increase crop yield as long as the average variable cost per bushel remains roughly the same or lower. In other words, as long as you do not spend too much money to get the extra yield.

v20151224 © Purdue University 8 

PURDUE UNIVERSITY

Our greatest agronomic challenge today is to stress-proof our crops against “normal” weather events.

v20151212 © Purdue

PURDUE UNIVERSITY

“Normal” Weather

“Normal” weather can be defined by an unpredictable number of unpredictable **extreme weather** events, each occurring unpredictably, with unpredictable severity.

↓

Greater climate variability today = Higher frequency of extreme weather events

v20151212 © Purdue
Image: <http://www.keepbanderabeautiful.org/climate-change.jpg>

PURDUE UNIVERSITY

The unfortunate reality ...

- Effects of unpredictable extreme weather on crop growth and yield are amplified by the existence of other yield limiting factors.
 - Excessive rainfall +
 - Poor soil drainage +
 - Compacted soil layers

Image source: Somewhere on the Web

v20151224 © Purdue University 12 

PURDUE
UNIVERSITY

The opportunity...

Identifying and managing these other yield limiting factors can help improve the **resilience** of your crops against the uncertainty of Mother Nature.

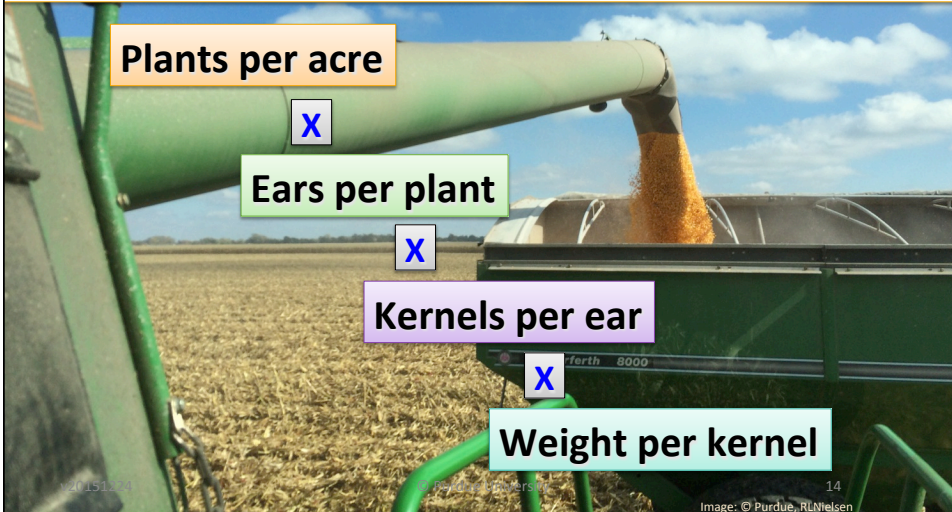

Image source: <http://typesofpoetry99.blogspot.com/2010/01/mother-nature.html>

v20151224 © Purdue University 13 

Grain yield is the product of the season-long development of four individual components of yield.

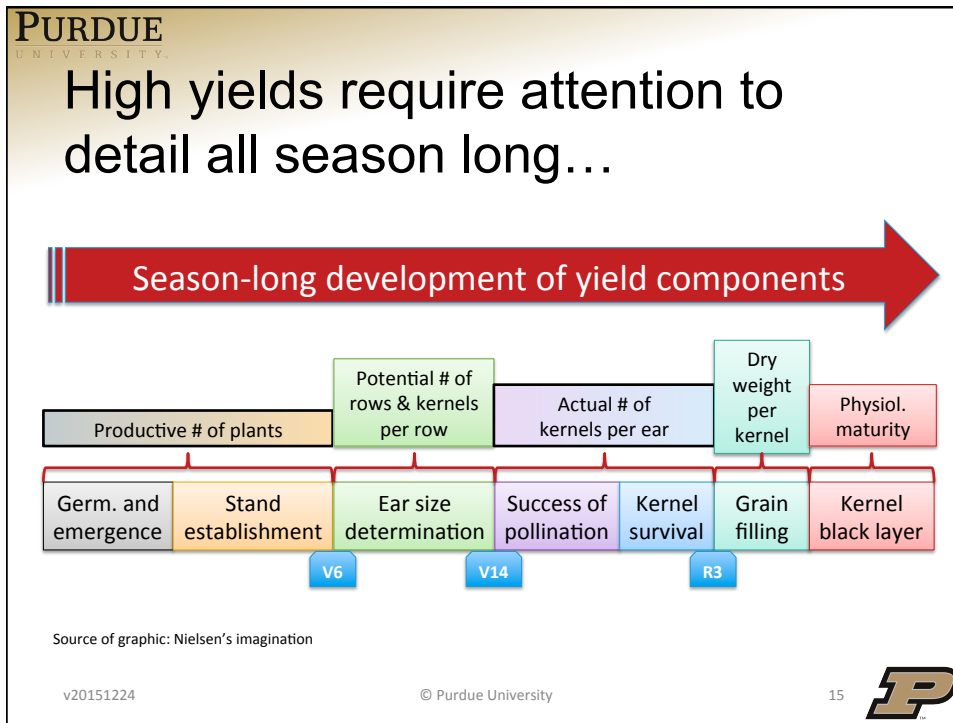

Plants per acre X

Ears per plant X

Kernels per ear X

Weight per kernel X

v20151224 © Purdue Univ. 14 Image: © Purdue, RLNielsen

PURDUE UNIVERSITY

The burden is on you...

- ...to first identify the YLFs specific to your fields...
- ... and then develop the strategies for attacking them.

v20151224 Image source: www.christart.com © Purdue University 20 

PURDUE UNIVERSITY

Low vs. high yielding areas...

- Some would say not to waste fertilizer dollars in the low-yielding areas.
 - When, in fact, maybe the area is low-yielding because it is deficient for soil nutrients and, therefore, actually needs more fertilizer than the higher-yielding areas.

v20151224 © Purdue University 22 

PURDUE
UNIVERSITY.

Low vs. high yielding areas...

- Some would say to simply position a “defensive” hybrid in those low-yielding areas to address the problem.
 - Unless you have identified the underlying causes of the low yields, you cannot smartly choose the appropriate set of “defensive” hybrid characteristics necessary to address the problem.

v20151224 © Purdue University 23 

PURDUE
UNIVERSITY.

How to identify YLFs?

- Spend time with your crops.
 - Learn all you can about important yield limiting factors.
 - Ask for help from experts.
 - Walk your fields, scout for problems, and take extensive notes throughout the entire growing season.
 - Document every aspect of your crop production.

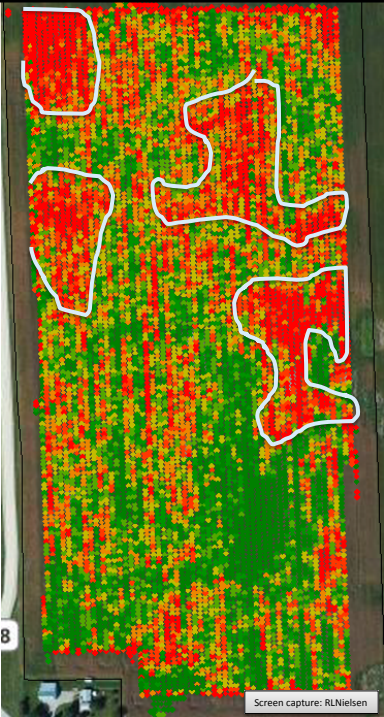

v20151224 © Purdue University Image: RLNielsen

PURDUE
UNIVERSITY

Use your yield monitor data...

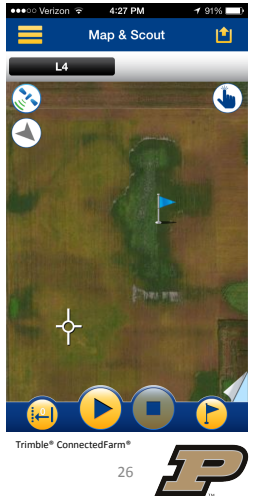

...to help you visualize problem areas and then physically navigate to those areas using your handheld scouting “app” to begin the diagnostic process.

v20151224 © Purdue University Screen capture: RLNielsen

Take advantage of handheld GPS technologies to map, GPS-tag & document problem areas in your fields

- Crop scouting & mapping “apps”
- Simple note-taking “apps”
- Smartphone cameras
- Use with other GIS information to help diagnose possible causes of problems

v20151224 © Purdue University 26

PURDUE
UNIVERSITY.

Remote sensing data...

- ...supplements yield maps in identifying and locating problem areas within your fields.
- ...can identify problem areas prior to harvest.
 - Earlier & more accurate crop problem diagnostics
 - Possible in-season mitigation of crop problems
- ...does not, however, diagnose the causes of crop problems by itself.
 - E.g., light green corn is not always N deficient.

v20151224 © Purdue University 27 

PURDUE
UNIVERSITY.

Options for imagery / reflectance

- Equipment-mounted crop sensors
 - e.g., GreenSeeker®, OptRx®
- Satellite imagery
- Aerial imagery
 - Handheld cameras
 - Professional cameras
 - Unmanned aircraft systems (UAS)

v20151224 © Purdue University
Image: <http://aerialfarmer.blogspot.com/>

PURDUE
UNIVERSITY.

However, be sure to use Precision Ag technologies to supplement, not replace, old-fashioned “boots on the ground” technology

Important Decision to Improve Crop Resilience

HYBRID SELECTION...

Copyrighted Photograph 1908 by W. H. Martin

The largest ear of corn grown in Nebr.

v20151224 © Purdue University Image source: Nebraska Historical Society 30 

PURDUE
UNIVERSITY

Hybrid selection...

- More \$\$ to be gained or lost with this agronomic decision than almost any other!
 - Yields among “good” hybrids can easily vary 20 to 40 bu/ac in same field!
- Identifying good hybrids is NOT easy!
- Farmers ought not to relegate this decision solely to their seed dealer.

Copyrighted Photograph 1908 by W.H. Martin
The largest ear of corn grown in Nebr.

v20151224 © Purdue University 31 

PURDUE
UNIVERSITY

Not simply about yield potential

- But, also the ability of hybrids to perform consistently well across a wide range of growing conditions... because you don't know what next year will bring.
- The evidence lies in the results of variety trials conducted across a wide range of locations, because those represent a “sampling” of possible growing conditions.

v20151224 © Purdue University 32

(Revised December 2014)

NUTRIENT MANAGEMENT for AGRONOMIC CROPS in Nebraska

N
IANR

Consider on-farm N rate trials

- Trials from 30 to 100+ acres, using farmers' own equipment and farming practices.
- From 4 to 6 N rates (usually sidedress app's)
 - At least 1 rate low enough to reduce yield and 1 rate higher than expected optimum rate
- Randomized and replicated no fewer than 3 times within the trial.

30 ac trial

79 29 229 129 179 lb N/acre

© Purdue University

38

PURDUE UNIVERSITY

The power of OFR...

...does not come just from what individual farmers learn from the trials they conduct on their own farm, because those results represent only a limited number of possible future growing conditions.

v20151224

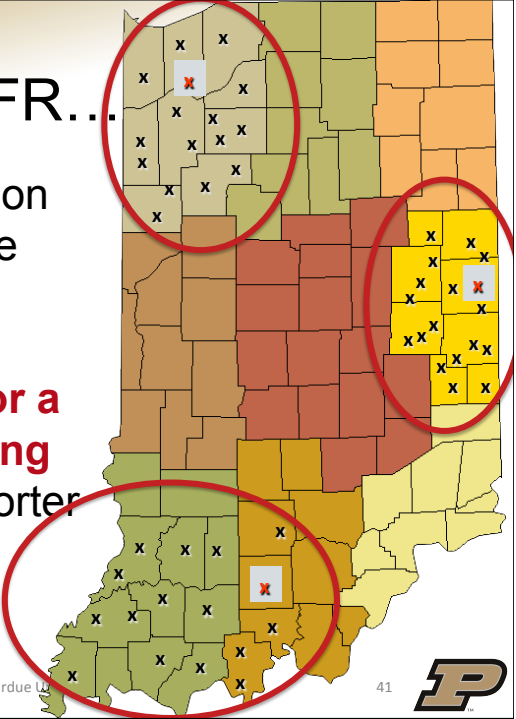

© Purdue University

40

PURDUE UNIVERSITY

The power of OFR...

...lies in the aggregation of results from multiple trials that allows us to develop more reliable **recommendations for a broader set of growing conditions** over a shorter period of time.

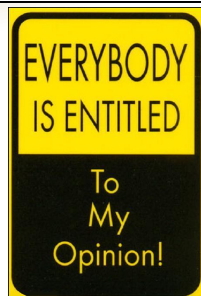

v20151224 © Purdue University 41 

PURDUE UNIVERSITY

One more opinion...

- With quantitative inputs like nitrogen fertilizer or seeding rate, there is no way we can evaluate the effects of every single possible rate.
- Consequently, we evaluate a few rates in order to develop “yield response curves” that are then used to mathematically estimate the actual optimum rate.

v20151224 © Purdue University 43 

PURDUE UNIVERSITY

Yield Response “Curves”

- In order to accurately determine the true mathematical “shape” of a yield response curve, no fewer than 4 rates, and preferably more than that, are required.
- Failure to do that can lead to incorrect, and costly, conclusions.

v20151224 © Purdue University

Corn Nitrogen Calculator for Nebraska

Look for it at CropWatch.UNL.edu

v20151224

Enter field-specific information in columns E to H				1 Example
1	Yield goal	5-yr avg. yield + 5-10%	bu/acre	165
2	Soil texture			Med./Fine
3	Soil organic matter (OM)	in 0-8" depth	%	2.6
4	Soil test nitrate-N	Effective rooting depth	inches	36
		Soil layers sampled	no.	3 Layers
		Layer 1 bottom	inches	8
		Layer 2 bottom	inches	24
		Layer 3 bottom	inches	36
	<i>select nitrate unit in box</i>			
	ppm	Layer 1 nitrate	ppm	12.5
		Layer 2 nitrate	ppm	7.1
		Layer 3 nitrate	ppm	1.7
5	Previous crop			02 Soybean
6	Irrigation	Water amount	inches	
		Water nitrate-N	ppm	
7	Manure	Type		
		Terms (unit for application)		
		Amount (tons or 1000 gal/acre)		
		Ammonium N	lb/unit	
		Organic N	lb/unit	
		Year applied		
		Application method		
8	Nitrogen management program			3 Fall
9	Expected corn value		\$/bu	\$3.30
10	N applied since harvest		lb/acre	0
	<i>do not enter anything below</i>			
	UNL N recommendation			
			Unit	1 Example
A	N algorithm components	Crop N requirement	lb/acre	233
		SOM credit	lb/acre	60
		Soil nitrate-N credit	lb/acre	40
		Legume N credit	lb/acre	45
		Irrigation N credit	lb/acre	Water?
		Manure N credit	lb/acre	Manure?
B	Recom. N amount (unadjusted)		lb/acre	88
C	Average nitrogen price		\$/lb N	\$0.34
D	Corn price : N price ratio			9.8
E	Recom. N amount (adjusted for time and prices)		lb/acre	100
F	Total N application cost		\$/acre	\$8.0
G	Total cost of N fertilizer + N application		\$/acre	\$41.6

MANAGING SEED COSTS: YIELD RESPONSE CURVES & ECONOMICS

v20151224 © Purdue University 17

PURDUE
UNIVERSITY.

Purdue plant population trials...

- Since 2008, we've conducted over 80 trials around Indiana.
 - All field-scale, majority are on-farm research.
 - Trials range in size from 30 to 100 acres.
- For what it's worth, harvest populations in the low 30's appear to be optimal for yield levels ranging from 140 to 250 bu/ac.

v20151224 © Purdue University

PURDUE
UNIVERSITY.

Know how. Know **now**.

G2216

Row Spacing and Seeding Rate Recommendations for Corn in Nebraska

v20151224 © Purdue University 49 

Consider on-farm seeding rate trials

- Designed w/ GIS software, implemented with seeding rate Rx's & VR controllers
- Ideally, 5 or 6 seeding rates to best model the yield response curve
 - At least 1 rate low enough to reduce yield and 1 rate higher than expected optimum rate
- Randomized and replicated no fewer than 3 times within a trial.

PURDUE UNIVERSITY

Some inputs are “crop insurance”

- Especially when applied without evidence of the crop's need for them.
 - Micronutrients
 - “Extra” seed treatments
 - Foliar insecticides
 - Foliar fungicides
 - “Too good to be true” products
- When not needed, are wasted \$\$
 - Use common sense when \$\$ are limited.

v20151224 © Purdue University 54 

PURDUE UNIVERSITY

Weed Management

- Know which weeds you are dealing with and which herbicides control them
- Be timely with herbicide applications relative to weed size
- Recognize & identify resistant weeds
- Do not rely solely on post-emergence herbicide applications

Image © Purdue Univ; RLNielsen

PURDUE UNIVERSITY

Mix / match herbicide activity

HERBICIDE CLASSIFICATION

REPEATED USE OF HERBICIDES WITH THE SAME SITE OF ACTION CAN RESULT IN THE DEVELOPMENT OF HERBICIDE-RESISTANT WEED POPULATIONS.

MODE OF ACTION
(effect on plant growth)

This chart groups herbicides by their modes of action to assist you in selecting herbicides (1) to maintain greater diversity in herbicide use and (2) to rotate among effective herbicides with different sites of action to delay the development of herbicide resistance.

by PREMIX

This chart lists premix herbicides alphabetically by their trade names so you can identify the premix's component herbicides and their respective site-of-action groups. Refer to the Site-of-Action chart on the left for more information.

SITE-OF-ACTION GROUP		NUMBER OF RESISTANT WEED SPECIES IN U.S.			COMPONENT SITE-OF-ACTION GROUP			COMPONENT SITE-OF-ACTION GROUP		
SITE OF ACTION	CHEMICAL FAMILY	ACTIVE INGREDIENT	PRODUCT EXAMPLES (TRADE NAME)	PREMIX	ACTIVE INGREDIENT	TRADE NAME	PREMIX	ACTIVE INGREDIENT	TRADE NAME	

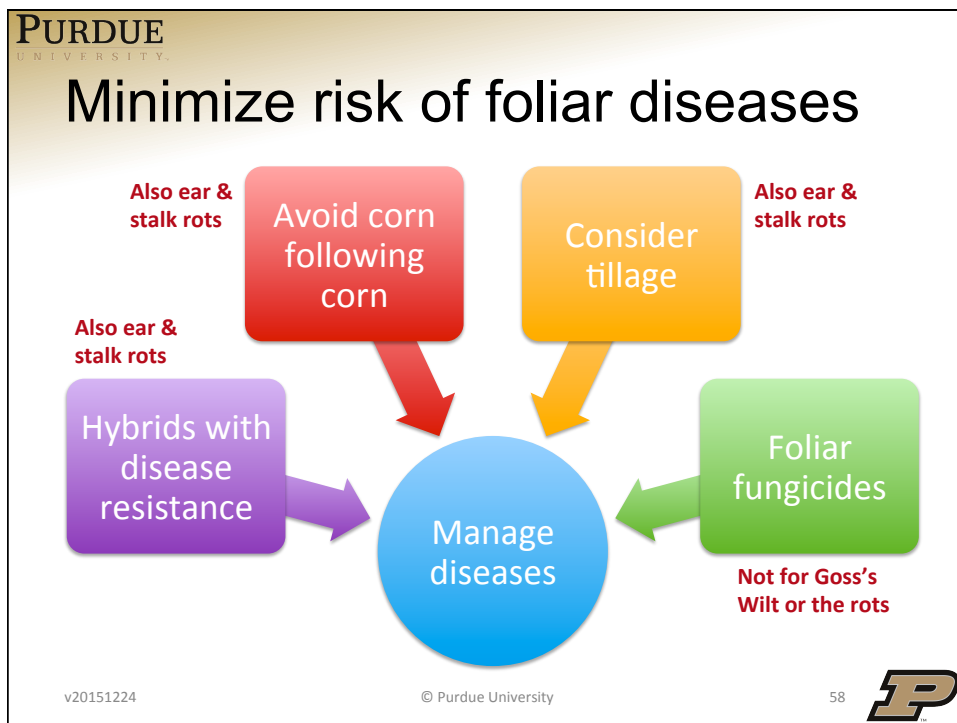

<https://goo.gl/VdWofU>

v20151224 © Purdue University 56 

Disease Management

- Know your diseases, confirm diagnoses by sending samples to UN-L diagnostic lab
- Important foliar diseases for corn include GLS, NCLB, Goss's Wilt, southern rust
- Ear rots (diplodia, gibberella, fusarium) are also common problem
- Stalk rots most likely when grain fill conditions are challenging
- Almost all overwinter on old corn residues

Image © Purdue Univ; RLNielsen © Purdue University 57

PURDUE UNIVERSITY

Improve Contribution Margins

Yield × Price - Var. Cost = Contrib. margin

- Increasing yield or decreasing costs can help increase the contribution margin when faced with low grain prices.
- Be judicious implementing either option.

v20151224 © Purdue University 59 

PURDUE UNIVERSITY

Focus on the fundamentals

- We all need to sharpen our focus on the agronomic fundamentals of growing corn.
- There are no “silver bullets” or “one size fits all” solutions to improving corn yields.
- Use today’s technologies to supplement your agronomic decision-making, not replace it.

v20151224 © Purdue University 60
