

Evaluating Winter Wheat Stands

Current Issue

Recommended seeding rates start at 1.2 million seeds per acre and increase as planting is delayed through October in southeast Nebraska up to 1.8 million seeds per acre. You can download the seeding rate Excel tool at croptechcafe.org/winterwheat. Evaluating your winter wheat stand and determining how many plants you have on a per acre basis is something most growers find difficult and time consuming. It is normal to use a tape measure to help count plants for corn and soybean, but not as ideal for wheat. Knowing what percentage of your seeding rate became established as plants is critical information to have to make future planting adjustments and also to make a determination, when stands are poor, to use the wheat as a cover crop.

Making your own grid for 1/10,000 of an acre

Supplies:

- One 10 ft piece of ½ inch PVC & Four PVC elbows for ½ inch pipe
- Measuring tape, saw, & permanent marker

Cut and Assemble: Dimensions to cut pipe for each row spacing:

- 7.5 inch row spacing
 - 22.5" wide and 28" long
- 8 inch row spacing
 - 24" wide and 26" long
- 10 inch row spacing
 - 30" wide and 21" long

Mark: With a permanent marker, add 3 lines (7.5, 8, or 10) inches apart to represent rows on each side (the side that is 22.5, 24, or 30" wide).

Assessing winter wheat stands

Count the number of plants for the three rows inside the grid in the fall or early spring with a **tally counter** (shown in picture) in several different areas of the field and then average those values. View the [Crop Tech Cafe YouTube demo](#) and these interpretations of the counts from 1/10,000 of an acre grid:

- **Less than 50 plants** – Likely due to high variability in the stand, consider using as a cover crop or forage crop (thicken with spring oats)
- **50 to 65 plants** – Reduced yield, can still yield well with good tillering and weed control
- **65 to 95 plants** – Close to max yield potential possible with good management
- **More than 95 plants** – Sufficient
